I deleted the alternative plans that we did not use, and renamed the remaining ones.

(Please refer to sample curves on the next page; R indicates "random")
Alt Plan 1 – one step, random
Alt Plan 2 – two steps, immediate start
Alt Plan 3 – two steps, random
Alt Plan 4 – three steps, immediate start
Alt Plan 5 – three steps, random (the second break in the graph is quite short, but there is one.)

Our first results only consisted of Plans 1, 2, 3. I do not recall how the "schemes" were constructed.

Our second set of experiments, which we should send to Evangelos soon, should consist of only Plans 1, 4, 5. I think Huiting will need to formulate the schemes again.
